

FIM-S3 SEMINAR

Ab initio spectroscopy and high-throughput screening of complex materials

Monday February 17th, 2025 – 11.00 (sharp)

S3 Seminar Room, 3rd Floor, Physics building

Remote link: [Teams](#)

Speaker

Caterina COCCHI – Carl von Ossietzky Universität Oldenburg, Germany

Abstract

Semiconducting photocathode materials are crucial for developing next-generation particle accelerators, enabling ultrabright electron sources. Experimental challenges in synthesizing and characterizing these compounds demand complementary efforts from state-of-the-art computational methods [1]. In this seminar, I will demonstrate how cutting-edge theoretical approaches have significantly advanced our understanding of these materials. First, I will illustrate how ab initio spectroscopy techniques have provided invaluable insights into their electronic and spectroscopic properties, from the visible to the core level regions [2-6]. Second, I will discuss how the development of automated simulation protocols has enabled the discovery of novel compositions and crystalline phases within the established classes of alkali antimonides and tellurides [7-10].
